

## Re-Defining Stress to Prevent Disease

Re-Defining Stress to Prevent Disease examines the causes of stress and how thought, perceptions, and learned experiences contribute to disease and illness. Steven Jaffe, the author, explores methods to reduce stress with simple and easy ways of preventing and/or reversing emotional and physical illnesses. Most people do not know how to live with stress. This lack of understanding causes the immune system to attack the body's organs, which in turn creates disease and illness at staggering rates. \*70% to 90% of all doctor visits are stress-related \*80% of most diseases have a direct link to stress. Stress cannot be eliminated; however, it can be looked at differently, re-defined, to teach the brain how to handle a stressful event. When a person reacts positively to stress, this reaction can set in motion a series of immune system defenses that can actually prevent illness and disease from entering the body. This perception change can improve your health before an illness manifests, or can help you recover from an existing serious illness.
